Broad-leafed paspalum is an unpalatable, introduced, hardy and adaptable grass that invades cattle and horse pastures by out-competing and replacing palatable native pasture species.

It tolerates both dense shade and drought conditions, grows quickly (particularly after rainfall), smothers less competitive grasses by spreading horizontally, produces a large number of seeds and has a high rate of germination.

Legal requirements

Broad-leaved paspalum is not a prohibited or restricted invasive plant under the Biosecurity Act 2014. However, by law, everyone has a general biosecurity obligation (GBO) to take reasonable and practical steps to minimise the risks associated with invasive plants and animals under their control.

Local governments must have a biosecurity plan that covers invasive plants and animals in their area. This plan may include actions to be taken on certain species. Some of these actions may be required under local laws. Contact your local government for more information.
**Description**

Broad-leaved paspalum has mature leaves more than 10 mm wide, bright green, have a crinkled margin and a tendency to spread. The lower section, 70–100 mm of leaf is usually maroon, burgundy or brown.

Flower stems can be over 1 m tall with up to 10 flower/seed stalks growing alternately down the stem. Ripe seed heads hang at about 45° if the stem is upright.

Individual tussocks can grow to 1 m wide and easily spread sideways, as the stems that make contact with the soil will form roots. Tussocks have a high degree of tolerance to mowing.

**Habitat and distribution**

Plants grow in open pasture, along roadside verges and in bush margins, but also in deeply-shaded sections of forest.

First discovered in cattle paddocks on the Atherton Tablelands in 2002. Reported in horticultural properties around Bellthorpe and Booroobin in 2004. Reported as growing on roadsides around the Blackall Range region 2004 onwards.

**Control**

Seedlings and smaller plants can be hand-pulled, bagged and composted or disposed of at the local garbage dump. Wear gloves, as the leaves and seed heads can cause skin irritation.

An integrated approach is required for larger infestations of broad-leaved paspalum. Ensure pastures are not over-grazed to allow competition from desired species. No single herbicide will be 100% effective. Take care when using non-selective herbicides that may cause damage to desired pasture species.

**Herbicide control**

Very little information is available on control of this species and the herbicides listed below are those that have been recommended for other paspalum species or grasses generally elsewhere.

**Further information**

Further information is available from your local government office, or by contacting Biosecurity Queensland on 13 25 23 or visit biosecurity.qld.gov.au.

Read the label carefully before use. Always use the herbicide in accordance with the directions on the label. **NOTE:** These herbicides can kill all grasses and glyphosate can also kill a range of other plants. Use with care.
