Noogoora burr
*Xanthium pungens*

Native to America, noogoora burr is an erect, annual herb with blotched purple stems. Noogoora burr is often abundant after spring or summer floods. The burrs tangle in animal fur causing injury.

Noogoora burr is found along river and creek flats, on roadsides and in pasture land following seasonal rain or floods.

The burrs readily contaminate wool, significantly reducing the value of the wool due to increased processing costs. Thick patches of noogoora burr may deny sheep access to watering points. Noogoora burr is also a serious competitor in pastures and summer crops.

Seedlings are poisonous to domestic stock, causing death if eaten in sufficient quantities.

**Legal requirements**

Noogoora burr is not a prohibited or restricted invasive plant under the *Biosecurity Act 2014*. However, by law, everyone has a general biosecurity obligation (GBO) to take reasonable and practical steps to minimise the risks associated with invasive plants and animals under their control.

Local governments must have a biosecurity plan that covers invasive plants and animals in their area. This plan may include actions to be taken on certain species. Some of these actions may be required under local laws. Contact your local government for more information.
Description
Noogoora burr is an shrub upright to 1 m high, occasionally 2.5 m high, short lived, usually an annual. The stems are green blotched purple and covered with stiff hairs. Leaves are dark green on upper surface, 15 cm in diameter and roughly textured with minute bristles. Lower leaves are arranged opposite while upper leaves are alternate. Flowers are greenish yellow and inconspicuous, separate male and female appearing in leaf axils towards the end of the branches. Fruit is hard, woody, spiny burrs, 1.2–2 cm long with hooked spines containing two seeds. Seeds are grey or black 4–5 mm long and 5–7 mm wide. They are flattened on one side, and one seed in each pair is usually slightly larger than the other

Habitat and distribution
Noogoora burr is widespread in Queensland, occurring in tropical regions and the central and western regions (where it prefers alluvial flood plains).

It can be found along river and creek flats, on roadsides and in pasture land. Noogoora burr spreads by seed in burrs. Burrs are spread by attaching to animals, clothing and bags. Burrs can also float on water.

Control
As noogoora burr is an annual, infestations will be reduced if seeding can be prevented.

Biological control
Some level of control has been achieved with biological control agents including stem-boring and stem-galling insects, and a rust fungus (*Puccinia xanthii*). This form of control has been more effective in tropical areas where temperatures and moisture conditions are favourable.

Mechanical control
Cultivation or hand pulling isolated plants is effective if performed before flowering or burr formation.

Herbicide control
Before using any herbicide always read the label carefully. All herbicides must be applied strictly in accordance with the directions on the label. Details of herbicides registered for the control of noogoora burr are listed in Table 1.

Spraying with 2,4-D or MCPA before flowering will give favourable results. As plants mature, higher rates are necessary.

Further information
Further information is available from your local government office, or by contacting Biosecurity Queensland on 13 25 23 or visit www.biosecurity.qld.gov.au.

### Table 1. Herbicides for the control of noogoora burr

<table>
<thead>
<tr>
<th>Situation</th>
